Forecast analysis - October experiment

Forecast analysis

Compare baseline results and save a recoverable checkpoint.

Cell 2 · Python

```
observations = [12, 18, 15, 21]
mean = sum(observations) / len(observations)
print(f'Mean: {mean:.1f}')
```

Recorded output · execution 1 · ok

```
Mean: 16.5
```

Cell 3 · Python

```
print('Preparing forecast...')
forecast = mean / 0
```

Recorded output · execution 2 · error

```
Preparing forecast...
```

ZeroDivisionError: float division by zero

```
Traceback (most recent call last):

    forecast = mean / 0
               ~~~~~^~~

ZeroDivisionError: float division by zero
```

Next experiment

Correct the denominator, rerun the forecast, then compare its recorded source.

Cell 5 · Python

```
for day, value in enumerate(observations, 1):
    print(f'Day {day}: {value}')
```

Recorded output · execution 3 · ok

```
Day 1: 12
Day 2: 18
```

```
Day 3: 15
Day 4: 21
```
